

THERAPYAUDIT® : Data Collection and Audit

THERAPYAUDIT® is a web-based software system enabling clinicians to collect data from any location within the NHS N3 network, confident of their data security. Clinical data is collected via a standard

----- Optional & by SMS / email

web browser or via TATouch™ (a touch screen module for self-scoring by patients in clinic), or TAMove™, a module for smart phones such as the iPhone®. Once collected data can be audited using industry-standard tools such as SQL, and reports made available to clinicians within the network, or via SMS or email to outside users and patients.

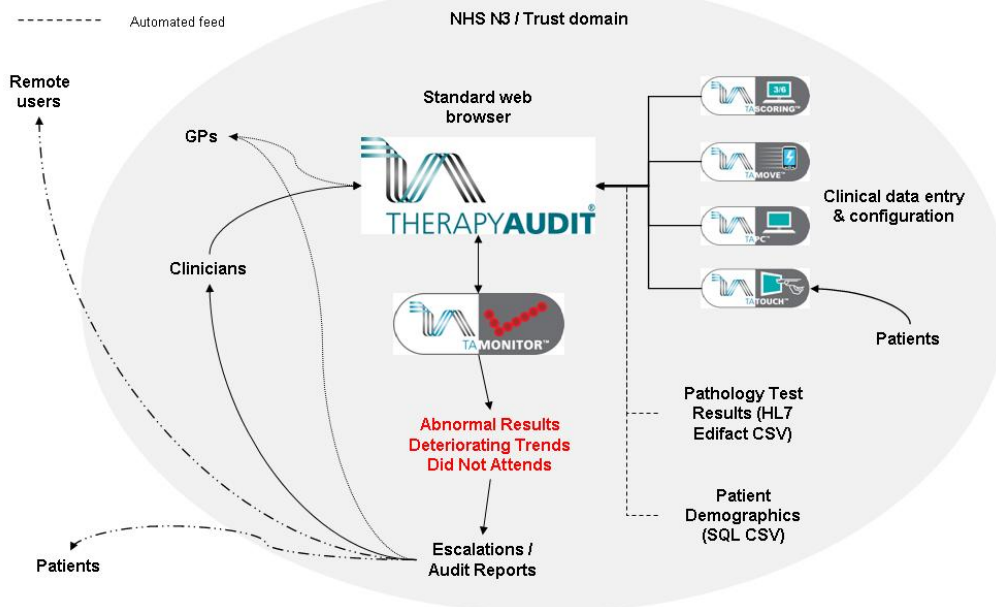

TAMonitor™ : Therapeutic Drug Monitoring

Add the TAMonitor module to THERAPYAUDIT and you have a powerful Therapeutic Drug Monitoring (TDM) system. Samples are tagged with a unique identifier (typically a location code) which enables your laboratory to send electronic copy of results to THERAPYAUDIT.

Once received, TAMonitor checks those results for abnormalities, deteriorating trends and patients who haven't attended for blood testing when expected against pre-set frequencies. Alerts such as abnormal results can be escalated to other clinical users and even GPs and other remote users by SMS or email. A full audit trail ensures all alerts are dealt with.

Forget about manually creating and amending record cards for patients from paper results. Simply notify your laboratory of those patients' details, and, provided your lab can produce electronic results, let TAMonitor's connection to a mailbox or hospital network collect the results and process them automatically.

..... Optional by email login to TA

 ----- Automated feed

Everything in TAMonitor is configurable. Lists of drugs, rules associated with them, reasons for cessation of treatment and diagnoses, can be added, changed or removed at will. Even the text for the automatically generated patients' and primary care physicians' letters can be altered.

TAMonitor even automates the onerous task of populating the patient database. If you have hundreds of patients to monitor the last thing you want to do is reserve precious resources typing each record in individually. TAMonitor can automatically identify new patients from received blood results, create a new patient record with as much demographic detail as is supplied in the result, and then prompt you to confirm the addition of the patient in the database. That means that you can start using TAMonitor from day one, without having to wait for all your patients to be added to the database.

The daily monitoring chore suddenly becomes a background task. Every morning start TAMonitor and let it collect the most recent results, scan, trend and audit them while you get on with other things. Collect the reports of any patients' problems, check them over, escalate them as necessary and get on with the business of providing patient care, confi-

dent that the monitoring task has been completed accurately.

TAMonitor is supported by a number of modules that further extends its use by providing correspondence, reporting, portability of data and linking to hospital patient administration systems.

TAMonitor is a multi-specialty drug monitoring system, and is available for primary and secondary care physicians. It can provide a complete TDM solution to the clinical governance requirements of 2nd line drug monitoring.
